

ADC Noise Reduction and Characterization of a Compact Michelson Interferometer

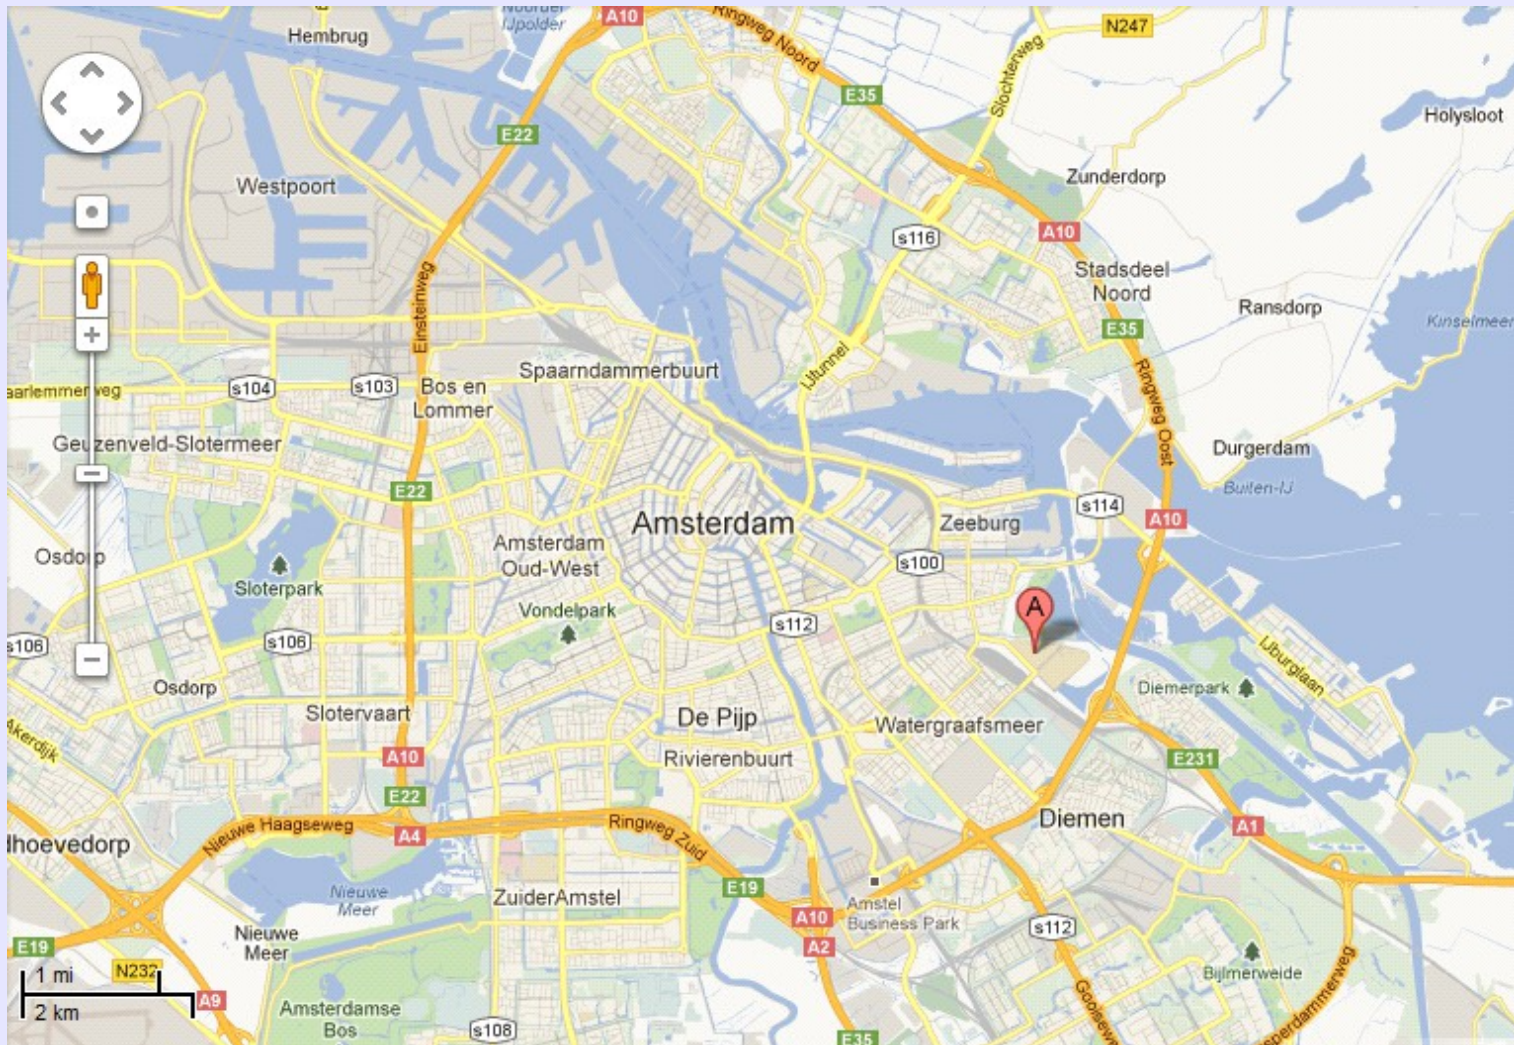

Kristen Zych
University of Florida
Research Experience for Undergraduates

- Nikhef
- National Institute for Subatomic Physics
(*Nationaal instituut voor subatomaire fysica*)
- In collaboration with VIRGO

- Located in Amsterdam, the Netherlands

Dr. David Rabeling

- Focus: Virgo, noise analysis

Dr. Jo van den Brand

- Focus: Virgo, LISA, LHCb

Mark Beker

- Graduate student

Motivation

- A MultiStage Attenuation System (MultiSAS) is being built
- Needs performance check
- Commercial seismometer or geophone isn't enough
- Need low noise readout for monolithic accelerometer

Weeks 1-3

Overview

- Learned how to use LabView
- Got comfortable with frequency space, PSD
- ADC quantization noise measurements

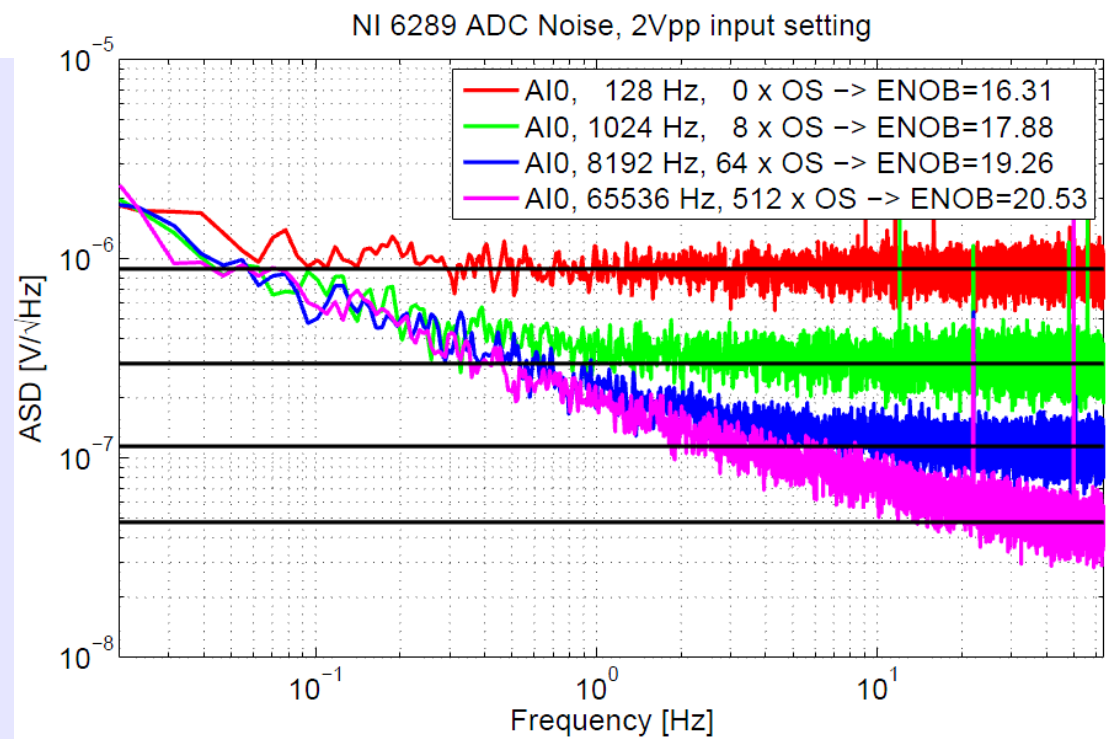

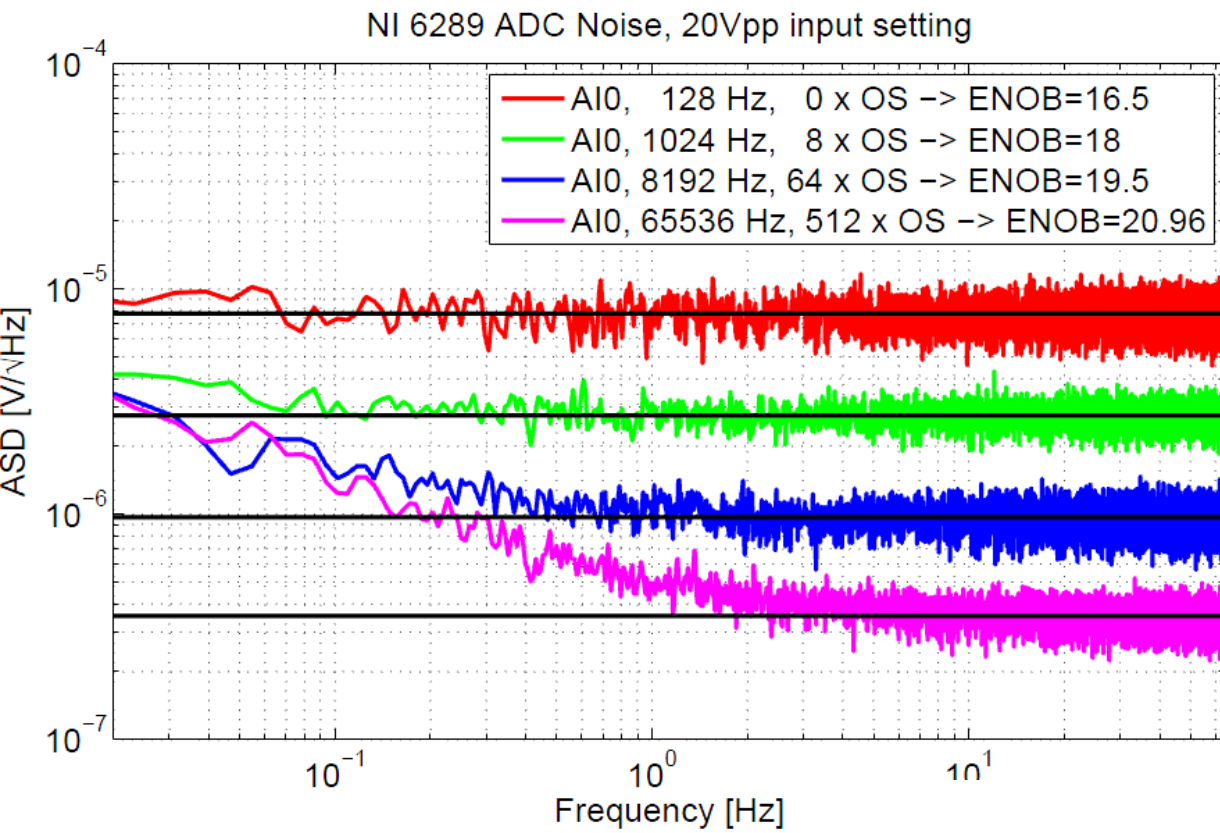

- Quantization noise comes from digitizing the waveform
- Evaluated the dynamic range of the ADC with ASD
- Oversampling
 - Sampling at a rate much higher than the target frequency
- Decimation
 - Averaging the data
- After a short derivation, we get this equation:

$$\Delta = \frac{V_{pp}}{2^N}$$

$$OSR = \frac{f_{os}}{f_s}$$

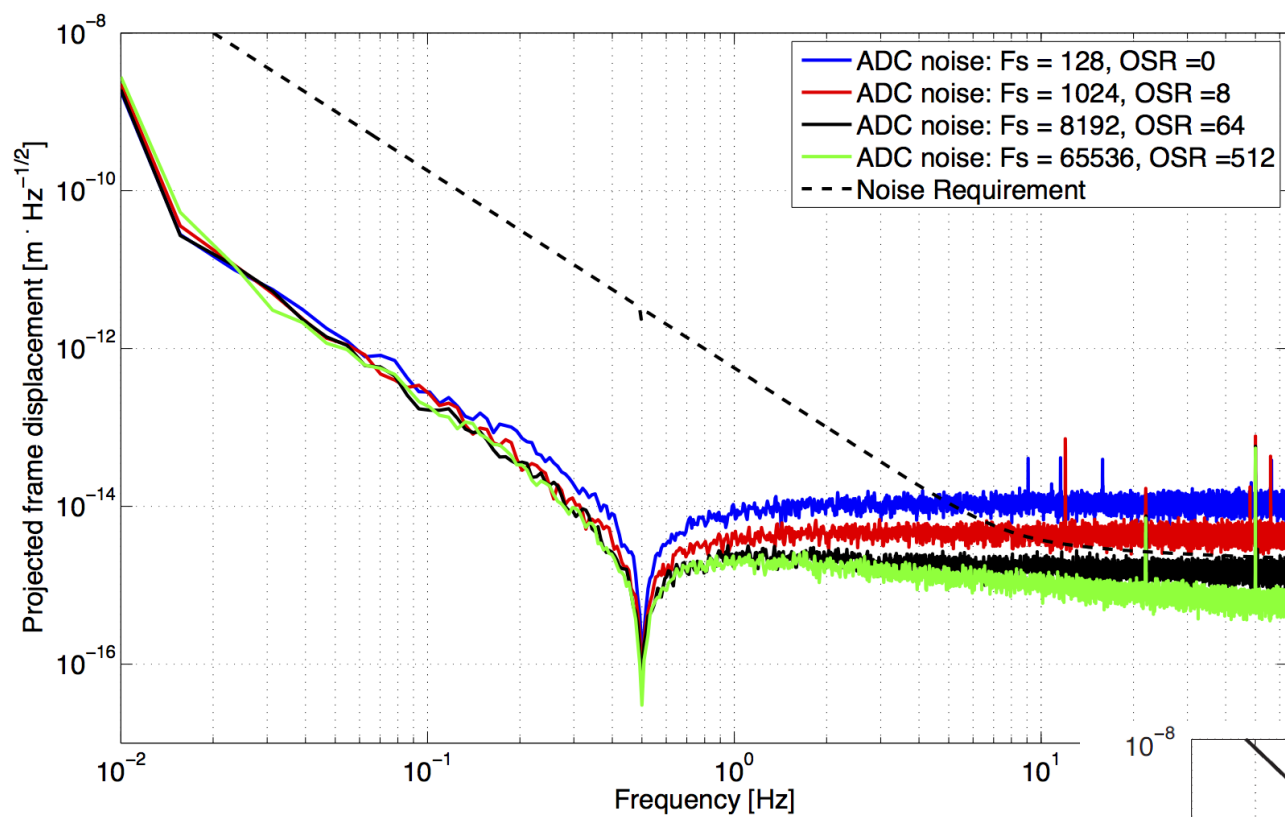

$$N = -\frac{1}{2} \frac{\log(OSR)}{\log(2)} - \frac{1}{2} \frac{\log(12 \cdot ASD_{noise})}{\log(2)} + \frac{\log(V_{pp})}{\log(2)}$$

- Decreased quantization noise
- Could not sample faster than 100 kS/s
- Not enough memory

- Using fewer channels did not decrease the noise level further

Week 4

Overview

- Virgo week!
- Helped dig holes, lay cement, take measurements
- Relay

Weeks 5-7

Overview

- Set up interferometer
- Worked on Labview frequency response VIs
- Control Theory
- Took transfer functions

- Attempted to find the correct arm lengths for the interferometer
 - Paper
 - Optical stage
- Set up interferometer with HeNe laser
 - Long coherence length

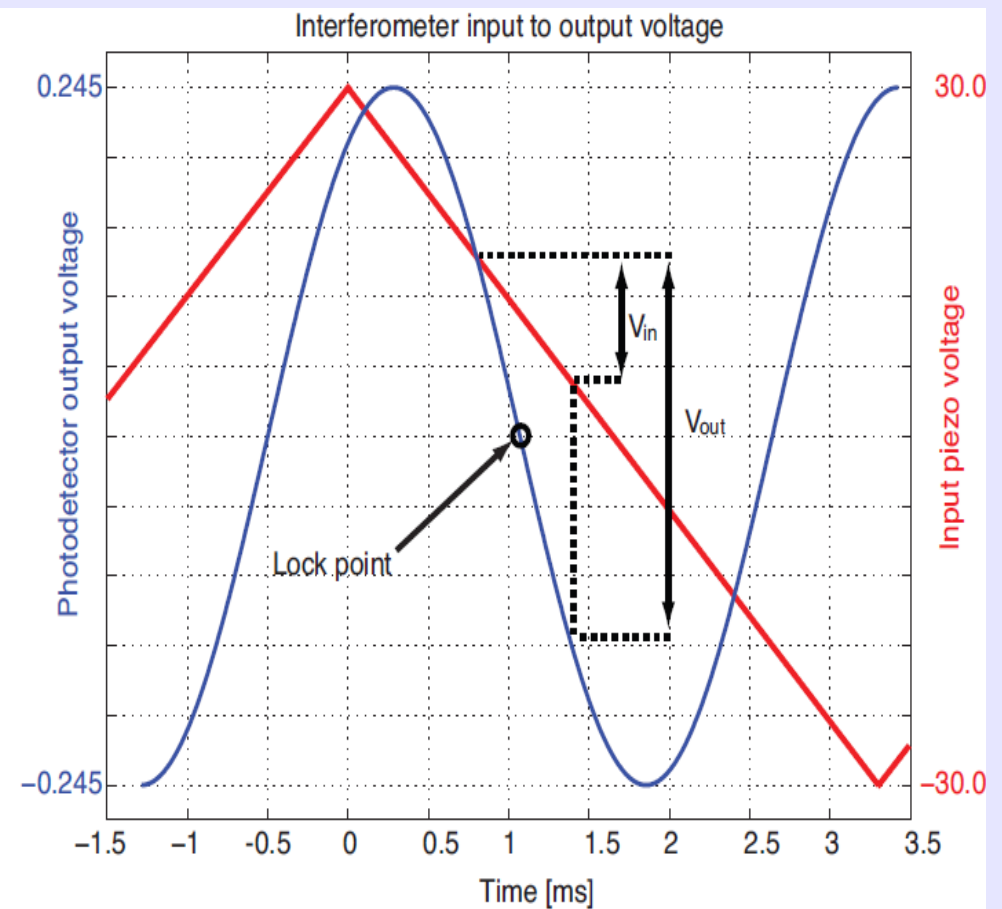

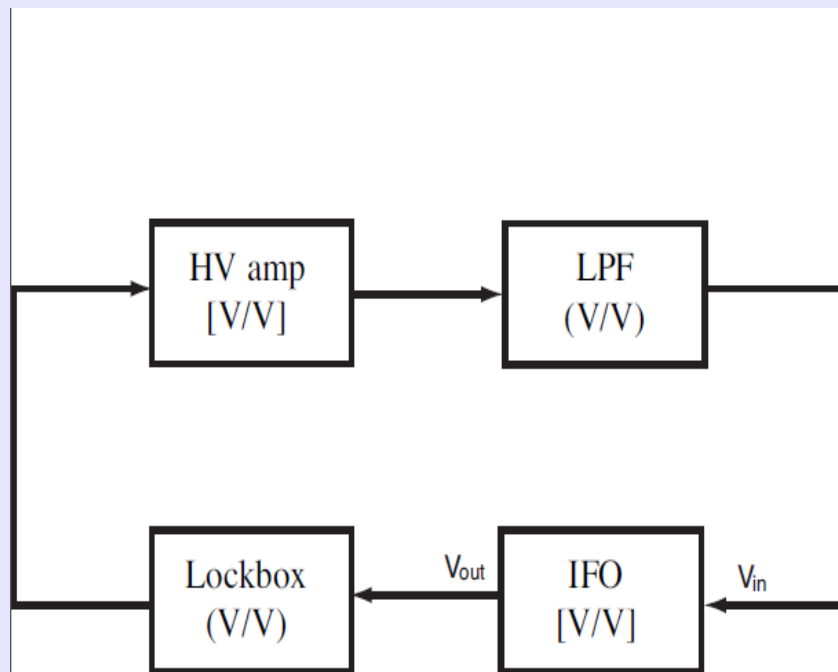

- Transfer functions exist in many forms and have many applications
- Frequency domain
- Find resonances
- Characterization of interferometer and environment

- Took transfer functions
 - LPF
 - Lockbox
 - HV Amp
 - Closed loop system

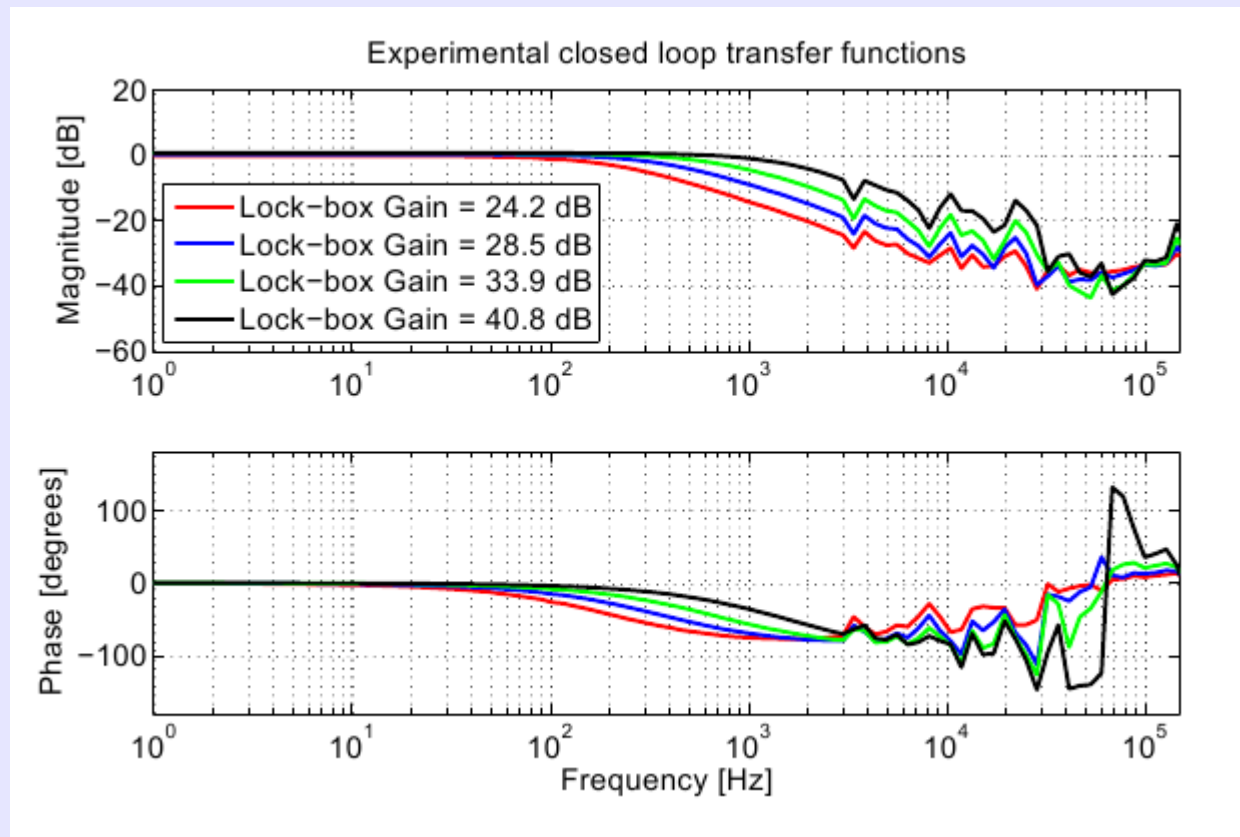

- Learned about control theory
 - Locking the interferometer

- We made a theoretical version of the loop in Matlab
- Bandwidth of 1.7kHz

- The experimental data had a bandwidth of 1.6kHz

- In conclusion, the ADC algorithm was implemented successfully and interferometer control system works as expected
- Further work will include
 - Getting arm lengths right for LED light source
 - Ultimately mounting the interferometer to the accelerometer
- Special thanks to David, Jo, Mark, and Mathieu
